

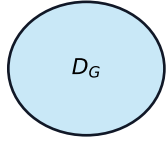

Figure 2. Six-case constructive and boundary-control panel

A Time-zero global witness

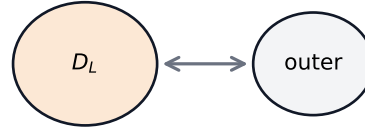

admission: time_zero_global

$$\theta_G = \theta_B = 1$$

B A2b local structural witness

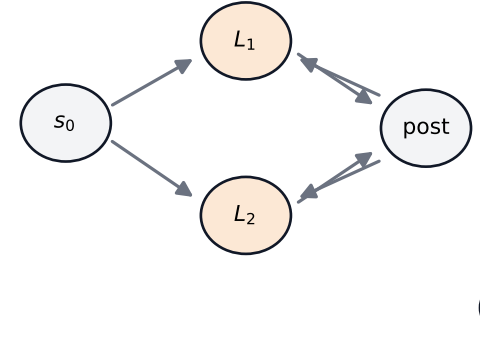

request-closed kernel; plant still has outer motion

$$\theta_L = \theta_B = 1$$

C Complete-LTS local witness

two local kernels; completion unreachable from either local kernel

D Completion-bypass boundary

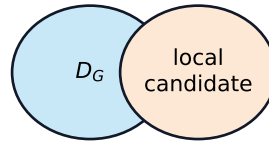

candidate rejected from D_L

$$\theta_B = 0$$

E Global-before-local precedence

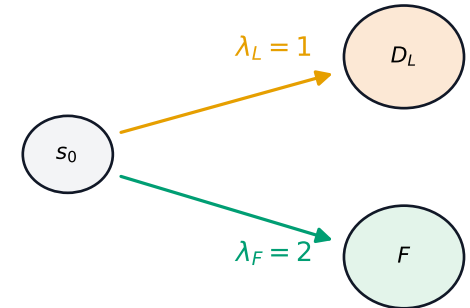

same state looks locally blocked but is counted once

assigned to D_G ; $D_G \cap D_L = \emptyset$

F Competing local/completion bridge

rates 1 and 2 from the same initial state

$$\theta_L = 1/(1 + 2) = 1/3$$
